

What Dogs Can & Can't Eat

YES PLEASE!

*Remember, all dogs have different dietary needs and we should be mindful of allergies. Human food should be fed to dogs in moderation.

PUMPKIN

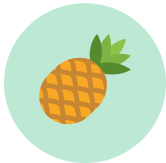

APPLE

BANANA

PEAR

PINEAPPLE

WATERMELON

STRAWBERRY

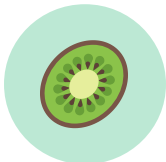

TOMATOES

HONEY

PEACHES

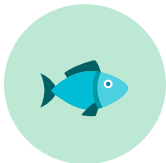

KIWI

GREEN PEAS

SHRIMP

FISH

COCONUT

CARROT

BROCCOLI

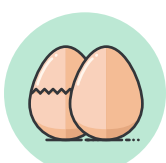

GREEN BEANS

BELL PEPPER

BLUE BERRIES

EGGS

AVOID THESE!

*If your dog ingests any of these substances please call your veterinarian

CHOCOLATE
and CAFFEINE

Chocolate contains a compound called theobromine which is similar to caffeine. Dogs are not able to process these compounds and ingestion can cause **vomiting, diarrhea, a racing heart beat, and seizures**. Milk chocolate is the least toxic and baking chocolate is the most toxic.

Grapes, raisins, and currants can cause **kidney failure** in dogs.

GRAPES

GARLIC and
ONION

Garlic and onion can **damage your dog's red blood cells**.

Bones and corn cobs may seem like tasty treats for dogs but they can easily **become stuck in your dog's esophagus or digestive track** and may require surgery to be removed.

BONES and
CORN

SUGAR

The sugar substitute Xylitol is extremely toxic to dogs. Ingestion causes a massive release of insulin which leads to **dangerously low blood sugar levels**. Xylitol can be found in gum, candies, toothpaste, baked goods, supplements and more.

Cannabis is not safe for dogs. **Dogs have more cannabinoid receptors** in their brain compared to humans, making even a small amount of cannabis toxic. Smoke inhalation is also dangerous.

CANNABIS

ALCOHOL

Dogs respond to alcohol similar to humans. If large quantities are ingested a dog can become **lethargic and uncoordinated**, experience **vomiting**, and is at risk for **hypothermia and collapse**.

A dog may come across a toxic type of mushroom while exploring outside. Some mushrooms cause only **gastro-intestinal upset** while others can have **life-threatening effects**.

MUSHROOMS

PAIN MEDS

Acetaminophen aka Tylenol, and ibuprofen aka Advil can **damage a dog's liver and red blood cells** if given at the incorrect dose. There are more appropriate pain meds for dogs.

NUTS

Not all nuts are necessarily toxic to dogs but they are high in fat which can lead to **pancreatic disease and obesity**. The additional salt added to nuts could cause **salt poisoning**. The shape of some nuts may also pose a **choking hazard**.
